

Removing Legacy Integrations

Today, if you remove a Yaml integration's config, its components will not be removed from the cluster automatically. You will also need to manually remove the custom resources from the Kubernetes cluster.

Removing Monitoring stack

You need to delete first the VMSingle and the VMAgent from the namespace :

```
kubect! delete vmsingle/monitoring -n <monitoring ns>
```

```
kubect! delete vmagent/monitoring -n <monitoring ns>
```

Once done, you can delete the namespace : `kubect! delete ns/<monitoring ns>`
