Installer 2022-08.01 fails to pull element web into the cluster

Issue

- After running the setup, the element web pod is stuck in `ImagePullBackoff`

Environment

- Element Enterprise Installer 2022-08.01

Resolution

It is necessary to uncomment the following variables in secrets.yml :

```
dockerhub_username:
dockerhub_token:
```

If you have a `dockerhub_username` and `dockerhub_token`, please define them in secrets.yml. If not, then please leave them blank but uncommented.

Root Cause

Version 2022-08.01 uses an element web image hosted in ems-image-store. A defect appeared during the migration of the image, and the installers looks for the variables `dockerhub_username` and `dockerhub_token` to

know if it has to configure docker secrets into the cluster.
