

# Integrator fails with Unable to initialise application. Failed to validate config: data/jitsi\_domain must match format "hostname"...

## Issue

- After installing integrator and browsing to it by hostname, I get the following error:  
`Unable to initialise application. Failed to validate config: data/jitsi_domain must match format "hostname", data/jitsi_domain must be equal to constant, data/jitsi_domain must match a schema in anyOf`

## Environment

- Element Enterprise Installer 2022-09.06
- Integrator

## Resolution

- Add the following line to your `<config-dir>/integrator/integrator.yml` file:  
`jitsi_domain: meet.element.io`  
Replacing `meet.element.io` with whatever Jitsi host you would like to use.

## Root Cause

There is a bug in this installer which specifies `https: //` in front of the default domain and this causes the error. This will be fixed in a future installer.
